

Sales Bulletin: ZM Series Helps Prevent Fraud

Product: Z-Series **Issue:** 1
Date Created: July, 2018 **Last Updated:**

Introduction:

Did you know that by using the USB or FTP protocols it can help to prevent fraud? By doing a very simple setup you can automate the recording of every transaction so that every time the operator presses the print key and a ticket is printed, the weights are then recorded to the transaction log.

Periodically, a USB memory stick can be plugged into the indicator in order to transfer the transaction log to the memory stick, which can then be opened in Excel for checking. Using the FTP protocol works in the same way, apart from the data will be live.

Example Applications:

- **Scrap Metal Merchants**

Metal merchants normally work in cash, based on weight, and are commonly affected by fraud. Using the transaction logs, this fraud can be reduced because the operators know that every transaction is recorded and can therefore be checked.

- **Selling of Products**

Any product sales based upon weight can be a target of fraud. Operators who give extra product away can cost the business money, however by using this method the business can quickly find the source of the giveaway and fix the issue.

- **Reporting**

This log can also be used for simple reporting, throughput of a product line or operator performance.
