Mobile Picking Solution

Verify Picking
Accuracy at the
Point of Pick

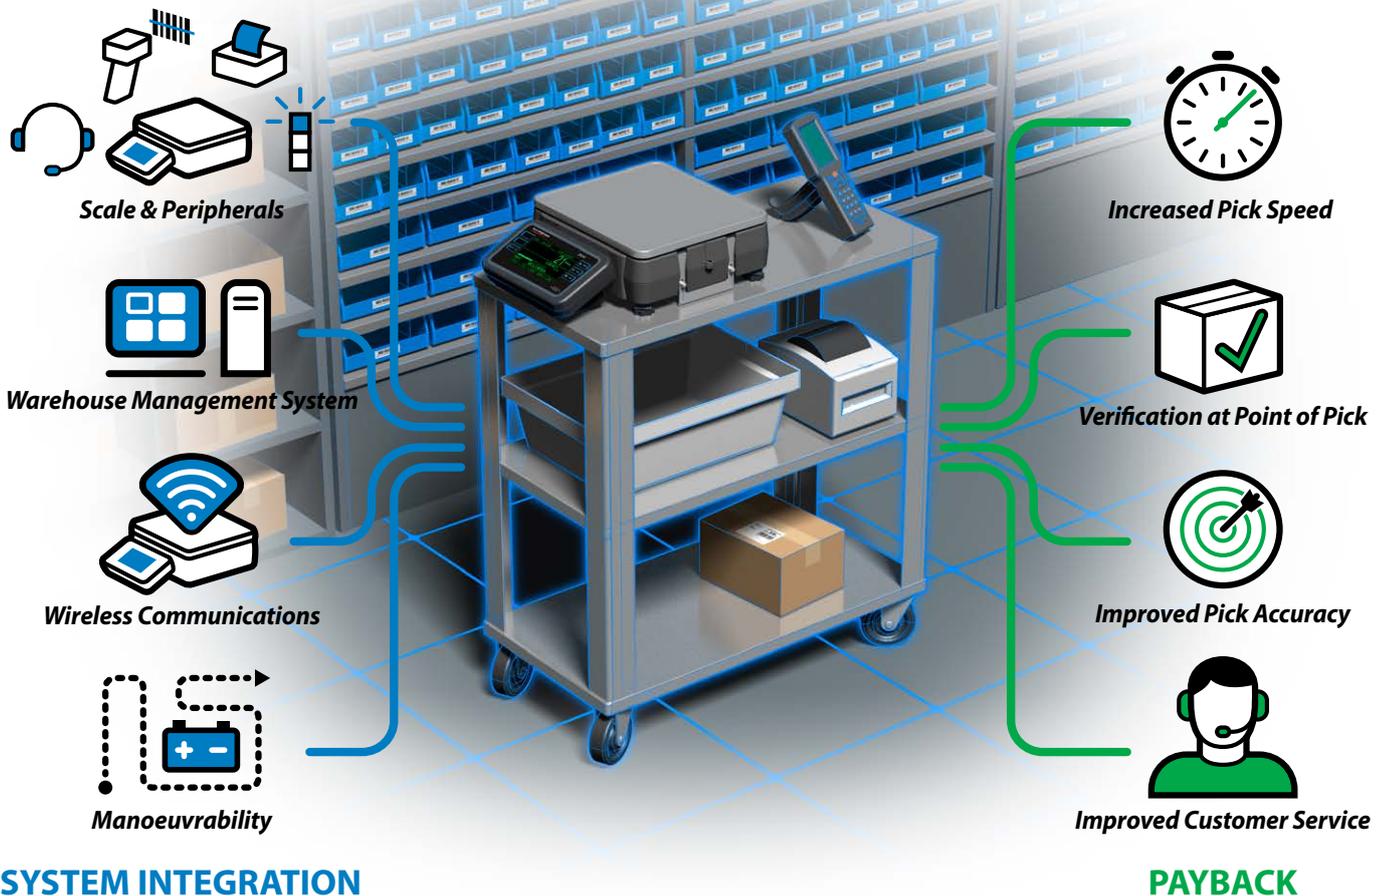

Verify picking accuracy without slowing your operation down

Pick & Pack Accurately

Avery Weigh-Tronix

In picking and packing operations, speed and accuracy are crucial for cost efficiency and can take a large amount of management attention. Packing the wrong item, miscounting quantities or putting labels on the wrong packages can cost a business hundreds of thousands of pounds a year in correction costs or contract penalties. Factor in the costs of quality control processes, time spent on correcting mis-picked orders, as well as potential impact on reputation, return shipping, loss of repeat business or dealing with customer complaints and picking accuracy can have a huge impact on your bottom line.

Quickly verify pick accuracy at the point of pick

Providing your pick operators with the tools and technology to verify accuracy at the point of pick puts quality control at the front of the picking process, without slowing operations down. The Avery Weigh-Tronix solution uses a mobile picking workstation that provides everything required to verify that the correct item and quantity have been picked. There are various options, depending on the level of integration with your Warehouse Management System (WMS) and picking technology that works for you.

Improved accuracy and speed

When slowing your processes down is not an option, the mobile picking workstation gives your picker access to everything they need to pick, verify and label an order from one easily movable workstation.

Reduce under and over-shipments and reworks

By verifying the accuracy of the pick before an order

is packed and dispatched, warehouses eliminate over and under fulfilment and remove the need for quality control and rework later in the process.

One-time touches and quality control

By verifying accuracy as part of the picking process, quality control is achieved in a single touch without needing to pass through a dedicated QC team, saving time and labour costs.

Managing inventory and replenishment

Avery Weigh-Tronix mobile workstations carry all the technology and tools required to allow pick operators to verify inventory in real time and compare it with the stock levels in your WMS, alleviating the need to have a dedicated audit process or take time out for wall-to-wall stock checks.

Improved customer service

The mobile workstation verifies pick accuracy at the point of pick, protecting your service quality and reputation and avoiding the risk of contractual penalties associated with picking errors.

Configurable solution to suit your requirements

The mobile picking workstation offers users easy access to everything that they need to verify picking accuracy quickly and efficiently at the point of pick. The combination of a robust yet configurable mobile picking trolley equipped with touch screen terminal, picking software, on-board battery power, WMS integration and a scale for accurate weight verification, provides the user with a quick and simple way to validate that they have picked the order correctly.

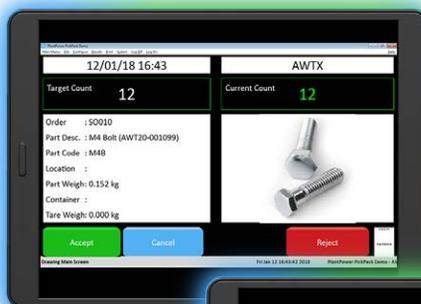

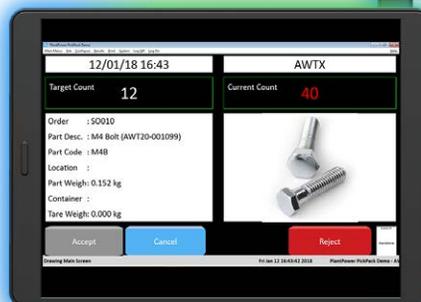

Scalable integration with back office systems

The technology on your mobile picking workstation can be fully integrated with your existing WMS to provide order, pick and piece-weight lists from your existing back office systems. If your operation does not have a WMS in place, our PlantPower software can bridge the gap, offering an easy to use interface that can be used to manage all aspects of stock movement and orders within your warehouse. Where your process does not require integration with WMS or back office systems, the workstation can also work as a stand-alone weight-based order verification tool.

Integration with order picking technology

The workstation can be fully-configured to allow integration with new or existing picking technology. The combination of technology and tools, along with integration with Pick-to-Voice and Pick-to-Light technology, speeds up the process by ensuring that an order picker has everything that they need close to hand.

Highly accurate weighing technology

When pick accuracy is driven by weight verification, using a highly accurate counting-scale to check piece-weights can make a difference to your bottom line. We offer the market's most-accurate counting scales, which have been specially designed to withstand constant, heavy use and dropped loads. With the option to display the weight on a tablet, on a user-friendly weight display, or to use a touch-screen to display user-prompts and messages, our choice of versatile counting scales are simple and easy to use.

Configurable mobile picking trolley

The height, length, and width of the picking trolley itself is fully configurable, making it suitable for a wide range of item sizes and weights, together with aisle widths and rack heights. The trolley is designed to provide easy access to everything required to pick, verify and label an order. Designed for the long haul, the trolleys provide users with the very best in quality, functionality and ergonomics and can be custom designed in a wide range of sizes and configuration of accessories. The on-board, quick-change and re-chargeable battery pack provides sufficient power to keep the workstation mobile and ready to use throughout a typical 12 hour shift.

Manual, powered and pulled solutions

Warehouses come in many shapes and sizes, making it essential that your staff have access to a picking workstation that suits the size and scope of your operation. Whether you require a solution that can be maneuvered manually between racking, or a powered solution which enables pickers to move more quickly around larger warehouses, we have a solution to fit.

Manual workstation: Our manual picking workstation is an ideal solution for smaller warehouses or zoned picking. Designed to be light and easy to move, the manual solution can be moved by the operator with minimal effort.

Powered workstation: When health and safety is key, the use of a powered solution reduces the strain that could be caused by pushing trolleys around warehouses for long periods of time, particularly if dealing with heavy items. This addition of a motor, with a simple stop and start mechanism, allows the operator to walk next to the workstation to move it from place to place with very little effort required.

Pulled workstation: In larger or less densely stocked warehouses, a pulled workstation offers a fast and efficient way for a picker to move from one area of the warehouse to another. Our pulled order picking solution combines the functionality of our manual and powered workstations, with the addition of an operator platform, allowing the operators to climb- aboard the truck and minimise the amount of time spent moving around the warehouse.

Uptime SELECT™

simply better service

Service options that keep your business running

With many warehouse operations now running 24/7 to meet the expectations of consumers, it is imperative that your equipment doesn't let you down. When the worst happens, our Uptime Select™ service plans maximise uptime and minimise disruption, to keep your business running.

- › **Guaranteed uptime, on us:** With our Care Total agreements: giving you the assurance of at least 97% uptime, or your money back*. Care packages include a generous - yet cost-effective - level of cover, including an agreed call out time, inclusive call out costs and preventative health checks.
- › **No-nonsense, transparent plans:** As the only provider in the market to offer simplified, transparent service agreements, it's easy to choose the right plan and put a stop to unexpected charges.
- › **Unbeatable response times:** Thanks to our extensive engineer network, help is never more than an average of 26 minutes away. Our 24/7 helpline is open 365 days a year, ready to dispatch a local engineer.
- › **Your own dedicated team of engineers:** Our team will get to know you, your equipment and your operation to offer the fastest response and maximise uptime.

- › **Compliance is at the core of our service:** As the industry leader we hold all standard accreditations and more. You can access calibration certificates, service visit reports and covered assets via our online portal, which is available whenever you need it.
